### Create a MySQL instance

#### Choose region and zonal availability

For better performance, keep your data close to the services that need it. Region is permanent, while zone can be changed any time.

Region: us-central1 (Iowa)

☐ Single zone  
In case of outage, no failover. Not recommended for production.

☒ Multiple zones (Highly available)  
Automatic failover to another zone within your selected region. Recommended for production instances. Increases cost. Enables binary logs (required for replication) and automatic backups. Make sure your storage can support at least 7 days of logs.
